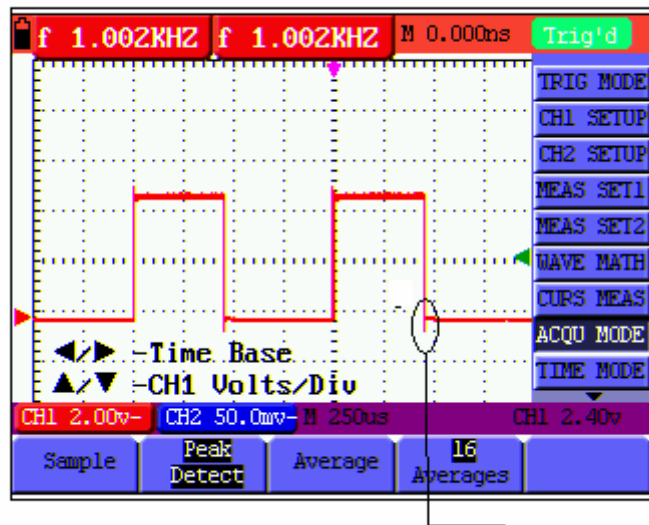

figure 16: Peak Detection

### Term interpretation

**Collecting mode:** The oscilloscope transforms the collected analog data into a digital form after they are gathered in the following three different modes, such as sampling, peak value detection and averaging values.

**Sampling:** The oscilloscope takes samples from the signal at a equal time interval to reconstruct the waveform in this mode, by which the analog signal can be expressed correctly in most cases, yet, the rapid changes can not be collected between two sampling time intervals, causing the confusion and loss the narrow pulse in the signal probably.

**Peak value detection:** The oscilloscope takes samples from the maximum and minimum of signals in each sampling interval and shows the waveform with the sampled data in this mode, thus, by which the oscilloscope may collect the possibly lost narrow pulse in the sampling mode but the noise is obvious.

**Averaging values:** the oscilloscope collects several waveforms and average over them, and displays the averaged waveform in this mode, by which the random noise can be reduced.

**Duration time:** When a new waveform is displayed, the previous waveform shown on the screen does not disappear immediately only to be displayed for a period of time, that is, the duration time, by setting which, the waveform can be displayed more continuously and thus a display similar to that shown by the analog oscilloscope can be achieved.

**Roll scan mode:** The oscilloscope updates the waveform sampling points by scrolling display through a screen from left to right in this mode, which is only applicable to the primary time base setting of above 50ms.

## 5.15 Selecting AC-coupling

After a reset, the Oscilloscope is dc-coupled so that ac and dc voltages appear on the screen, Use ac-coupling when you wish to observe a small ac signal that rides on a dc signal. To select ac-coupling, do the following:

## 7.4 Setting the Trigger System

The Trigger defines the time when the acquisition of data and display of waveform start. If it is set correctly, the trigger can turn an unstable display into a significant waveform.

When starting the acquisition of data, the oscilloscope collects sufficient data to draw the waveform at the left side of the triggering point. With waiting for the triggering condition, the oscilloscope is gathering data continuously. After a trigger is detected, the oscilloscope gathers enough data continuously to draw the waveform at the right side of the triggering point.

To make a trigger mode setting, do the following:

1. Press the **MENU** key and the function menu appears at the right of the screen.
2. Press the **MENU ▲** or **MENU ▼** key to select TRIG MODE and five items selectable are displayed at the bottom of the screen.

The Edge triggering is a mode by which trigger occurs at the triggering threshold value of the input signal edge. With the **Edge triggering** selected, the trigger happens on the rise or fall edge of the input signal, shown as the following figure.

The **Edge triggering** menu is described in the following table.

Function menu	Settings	Description
Slope	Rise	Triggering on the rise edge of the signal.
	Fall	Triggering on the fall edge of the signal.
Signal source	CH1 CH2	CH1 is used as the trigger source. CH2 is used as the trigger source.
Trigger mode	Auto	Acquisition of waveforms is possible even if there is no triggering condition detected.
	Normal	Acquisition of waveforms can only be done when the triggering condition is satisfied.

	Single shot	The sampling is performed on a waveform when one trigger is detected, then stop sampling. .
Coupling	AC	With this mode selected, the DC component is prevented from passing-through.
	DC	All dc components are allowed.
	HF suppression	The HF part of the signal is prohibited and only the HF component is allowed.
	LF suppression	The LF part of the signal is prohibited and only the LF component is allowed.

### 7.5.2 Video Triggering

With **Video triggering** selected, the oscilloscope performs the **NTSC, PAL or SECAM** standard video signals field or line trigger.

	Invert	Applicable to the video signal of which the black level is of high level.
Signal source	CH1	Select CH1 as the trigger source.
	CH2	Select CH2 as the trigger source.
SYNC	Line	Make a video line trigger synchronization setting
	Field	Make a video field trigger synchronization setting.

**Term interpretation**

**Trigger modes:** There are three kinds of trigger modes available for this oscilloscope, including auto, normal and single shot.

**Automatic trigger mode:** The oscilloscope can acquire the waveform without any triggering condition detected in this mode, in which it will be triggered compulsively when waiting for a specified period of time without any triggering condition ignited. When an invalid trigger is enforced, the oscilloscope can not keep the waveform in phase.

**Normal trigger mode:** In this mode, the oscilloscope cannot acquire the waveform till it is triggered. When there is not any trigger, the oscilloscope will display the origin waveform without new waveforms captured.

**Single shot mode:** In this mode, the oscilloscope will detect a trigger and capture a waveform at each time when the customer presses the RUN/STOP key.

## 7.14 Data Transmission

For the operation of data transmission, please execute the following steps:

1. Press **MENU** key, display the function menu on the right side of the screen.
2. Press **MENU ▲** or **MENU ▼** key to select display setting mode, display four options at the bottom.
3. Press **F4** key, and select the **Bitmap** or **Vectors** for data transmission.
4. Use a data line to connect the oscilloscope and the PC.

5. Open the DIGIMESS software that had been installed completely.
6. Setting the parameter under the use's manual, and then starts data transmission.

## 8. Trouble Shooting

### 1. The oscilloscope can not boot up.

It may be caused by the low battery. In this case, the oscilloscope can not boot up even after power on. To solve the problem, charge up the battery and supply the oscilloscope with power by using the battery charger. Only switch on the oscilloscope after charging for 15 minutes. If the oscilloscope still can not boot up, please contact DIGIMESS for service.

### 2. The oscilloscope stops working after operate for a few seconds

Find out whether the battery has been run out by checking the battery symbol at the upper right of the screen. If the symbol  turns up, it indicates that the battery has been run out of power and must be charged.

### 3. The measurement type displays ERR when switched to the multimeter mode.

Make sure an appropriate measuring mode is selected. To select a measuring mode, press one of the keys among V, A and R to display the relative measuring mode on the screen. If the ERR is still displayed, restart the oscilloscope.

### 4. The measured voltage amplitude value is 10 times larger or smaller than the actual one under the oscilloscope mode.

Check whether the channel attenuation factor and the actual probe error ratio match.

### 5. The waveform is displayed on the screen is not stable under the oscilloscope mode.

- Check whether the signal item in the trigger mode menu and the actually used signal channel match.
- Check the trigger mode: The edge trigger mode is applicable to the universal signal and the video trigger mode applicable to the video signal. The displayed waveform can be stable only when the proper trigger mode is applied.
- Try to change the trigger coupling into the HF repression and LF repression to filter the HF or LF noise trigger by the interference.

### 6. There is no display on the screen when you push down RUN/STOP key under the oscilloscope mode.

Check whether the trigger mode in the trigger mode menu is in normal or single shot and whether the trigger level is out of the waveform range.

In this case, adjust and set the trigger level in the middle or select the non-auto trigger mode.

Alternatively, press the AUTO SET key to complete the above setting.

- 7. When the average sampling in the sampling mode or a longer display time is selected in the display mode under the oscilloscope mode, the display speed is slow.**

It is normal in the above case.

## 9.2 Appendix B: Maintenance and Cleaning

### 9.2.1 Common Maintenance

Do not store or place the instrument in locations where the liquid crystal display (LCD) may be directly exposed to the sunshine for a long time.

**Be careful:** Do not make spraying agent, liquid and solvent touch with probes to avoid the instrument or probe being damaged.

#### Cleaning

Inspect the instrument and the probe frequently in accordance with operating conditions. Clean the outer surface of the instrument according to the following steps:

1. Wipe off the floating dust outside of the instrument and the probe by using soft cloth. When cleaning the LCD, do not scuff the transparent LCD protective screen.
2. Wipe the instrument in power off status by soft cloth that is moist but not dripping. It is allowed to be cleaned by soft detergent or fresh water. Do not use any abrasive chemical detergent to avoid the instrument or the probe being damaged.

**Warning:** Before re-powering and reuse, please confirm that the instrument has been dried out so as to avoid electrical short circuit and personal injury caused by moisture.

### 9.2.2 Storage of Oscilloscope

If the test tool is to be stored for a long time, it is required to charge the lithium battery before storage.

#### Charging the oscilloscope

The lithium battery is possibly not charged when delivery. To make the battery with enough electric quantity, it must be charged for 4 hours (the test tool must be turned off during charging). The battery can supply power for 4 hours after being charged completely.

When supplying power by using the battery, a battery indicator is displayed on the top of the screen to show the consumption condition of electric quantity. The symbols that are possibly appear include , , and , where shows that the battery can only be used for about 5 minutes. To

charge the battery and power the instrument, connect the oscilloscope using a power adapter according to Figure 1 to charge the battery. The charging speed can be increased by turning off the test tool.

#### Notice

To avoid superheat of battery during charging, the environment temperature is not allowed to exceed the permissible value given in technical specification.

#### Note:

No hazard will occur even connecting the charger for a long time, e.g. during a whole weekend. The instrument can automatically switch to slowly charging status.

### **9.2.3 Replacing the Lithium Battery Unit**

It is usually not required to replace the battery unit. But when it is required to replace it, only qualified personnel can carry out this operation, and only use the same specification lithium battery.
